# VALIDATION OF VIRAL REMOVAL/INACTIVATION AND BIOANALYTICAL METHODS

First ASEAN Overview Workshop on cGMP for  
Biologicals/ Biosimilars  
Generics and Biosimilars Initiative (GaBI)  
05 August 2018, Da Nang, Vietnam

**DINESH KHOKAL, PH.D.**

DIRECTOR, EXTERNAL AFFAIRS, JAPAC & LATAM

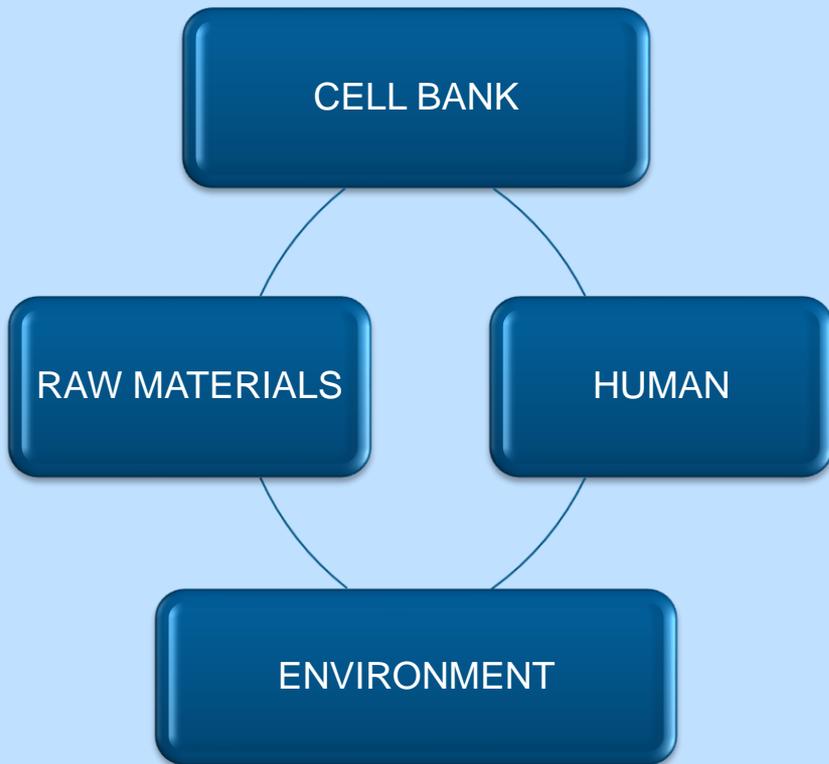

**AMGEN**

Pioneering science delivers vital medicines™

# SYNOPSIS

- **Introduction**
- **Validation of viral removal/  
inactivation**
- **Bioanalytical method validation**

# POTENTIAL SOURCE OF VIRUS CONTAMINATION

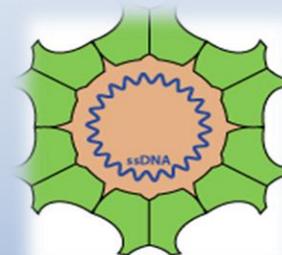

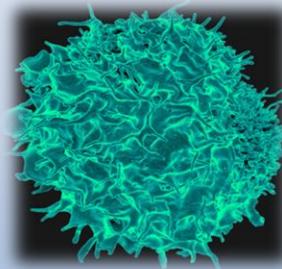

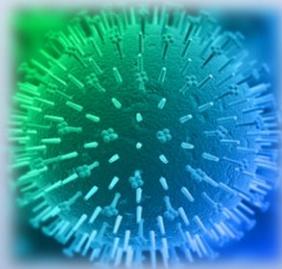

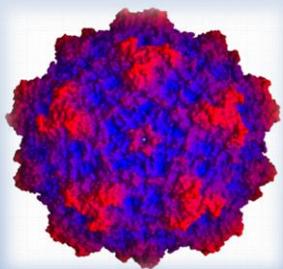

Viral contamination of biotechnology products may arise from the original source of the cell lines or from adventitious introduction of virus during production processes

- Risk to all biologics
- Risk due to materials of animal or human origin used
- Number of biologics have been contaminated
- Virus only identified many years after the product manufacture
- Cause – Contamination of the starting or source material

# VIRUS CONTAMINATION IN BIO-PROCESSING INDUSTRY

## Reported viral contamination

Minute virus of mice (MMV), Retrovirus type 3 (Reo-3), Calicivirus (Feline virus), Circovirus (Porcine virus)

## Significant impact

- Product quality
- Facility shutdowns
- Disruption of medicine supply
- Business impact

# VIRAL RISK MITIGATION STRATEGIES

- **Main approaches**
  - **Plant Design & contamination control**
  - **Selecting and testing source material**
    - **Control of source materials**
    - **Cell line development**
    - **Virus testing for cell bank**
  - **Testing the clearance capacity of the production processes**
    - **Testing of In-process products**
  - **Testing the product for freedom from detectable viruses**

No approach provides sufficient level of assurance alone

# WHY VIRUS CLEARANCE/INACTIVATION VALIDATION?

- No single test is able to demonstrate the presence of all known viruses
- All test systems require a minimum level of viral contamination to record a positive result
- Tests are also limited by statistical considerations in sampling

Establishing the freedom of a biological product from virus will not derive solely from testing but also from a demonstration that the manufacturing process is capable of removing or inactivating them

Validation of the process for viral removal/ inactivation play an essential and important role in establishing product safety

# VIRAL CLEARANCE METHODS

## Virus inactivation methods

- **Chemical methods**
  - Low pH incubation
  - Surfactant / Detergent
- **Physical methods**
  - Heat treatment
  - UV

## Virus removal methods

- **Precipitation**
  - Ammonium sulfate, etc.
- **Column Chromatography**
  - Ion Exchange
  - Size exclusion
  - Affinity
  - Reverse phase
  - Hydrophobic interaction
- **Membrane filtration**
- **Nanofiltration**

# SYNOPSIS

- Introduction
- **Validation of viral removal/  
inactivation**
- Bioanalytical method validation

# AIM OF VIRAL REMOVAL VALIDATION

To demonstrate that manufacturing/ purification processes can eliminate substantially more virus than what may potentially be present in the unprocessed bulk material

To obtain the best reasonable assurance that the product is free of virus contamination

# RATIONALE FOR VIRAL VALIDATION

Explanation & justification

- Approach & choice of viruses

Manufacturing conditions

- Representative of wide range of physico-chemical properties

Characterisation of virus

- Viruses that are known to be present
- Non-specific “model” viruses

Knowledge on virus

- Virus present in the manufacturing process
- Virus that can be cleared to assess product safety

Relevant validation protocol

- Virus tests from the Master Cell Bank (MCB)
- Various steps of production
- Final product

Evaluation & characterisation

- Viral clearance from unprocessed bulk
- Various process steps studied independently

Virus “spiking“

- Addition of significant amounts of virus to crude material &/or to different fractions obtained during the various process steps

Clearance results

- Log clearance results from orthogonal steps are added together to give overall figure for the process as a whole

# CHOICE OF VIRUSES FOR VIRAL CLEARANCE STUDY

A major issue is to determine which viruses should be used

- **Three categories**

1. **"Relevant" viruses**

- known viruses or same species as that are known or likely to be present

2. **Specific "model" viruses**

- substitute viruses, closely related, similar physical & chemical properties

3. **Non-specific "model" viruses**

- viruses displaying significant resistance to physical and/or chemical treatments

# OTHER CONSIDERATIONS

## Choice of Virus

- Viruses which can be grown to high titer are desirable

## Assay

- Availability of an efficient and reliable assay for the detection of each virus

## Health hazard

- Certain viruses may pose health hazard to the personnel performing the clearance studies

## Introduction of Virus

- Inappropriate to introduce any virus into a production facility because of GMP constraints and safety

## Specialized Laboratory

- Viral clearance studies should be conducted in a separate laboratory equipped for virological work

## Virology expertise

- Performed by staff with virological expertise
- Production personnel involved in designing and preparing a scaled-down version of the purification process

# SCALED-DOWN PRODUCTION SYSTEM AND SPIKING

## Scale down study

- Validity of the scaling down should be demonstrated

## Spiking & sampling

- Ensure spiking experiments and sample collection are relatively straightforward

## Simulation of production process

- Level of purification of the scaled-down version should represent as closely as possible the production procedure

## Simulation of commercial-scale manufacturing

- Chromatographic equipment, column bed-height, linear flow-rate, flow-rate-to-bed-volume ratio (i.e., contact time), buffer and gel types, pH, temperature, and concentration of protein, salt, and product

## Deviations

- Deviations which cannot be avoided should be discussed with regard to their influence on the results

# ASSAY METHODS – ACCURACY AND VALIDATION

## Assay types

- Wide variety of assay types can be used to detect and quantify viral liter
- Each assay type has specific advantages and disadvantages

## Accuracy & reproducibility

- Methods must provide accurate and reproducible quantitation of the viral concentration

## Variability of assay

- Virus detection assays can result in high variable results due to biological nature of the assay systems

## Reliability of results

- Test data generated must provide a reliable estimate of process reduction factors

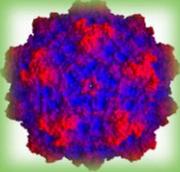

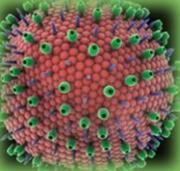

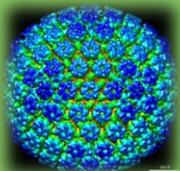

## Expression of results

- Viral concentrations are normally expressed with 95% confidence limit that should be on the order of 5% log of the mean

## Main assay types

- Vitro assay to quantitate infectious virus in viral clearance studies:
  - 1) plaque (or focus) formation assay
  - 2) cytopathic effect (CPE) assay

# VIRUS USED TO VALIDATE PRODUCTS DERIVED FROM MURINE HYBRIDOMA AND CELL LINE

Virus	Genome	Size (nm)	Enveloped?	Resistance
<b>Minute virus of mice (MMV)</b> 	ss-DNA	18-26	No	Very high
<b>Retrovirus type 3 (Reo-3)</b> 	ds-RNA	60-80	No	High
<b>Murine leukemia virus (MuLV)</b> 	ss-RNA	80-130	Yes	Low
<b>Pseudorabies virus (PRV)</b> 	ds-DNA	150-200	Yes	Low-medium

# SMALL SCALE VIRAL CLEARANCE STUDY

[http://www.ich.org/fileadmin/Public\\_Web\\_Site/ICH\\_Products/Guidelines/Quality/Q5A\\_R1/Step4/Q5A\\_R1\\_\\_Guideline.pdf](http://www.ich.org/fileadmin/Public_Web_Site/ICH_Products/Guidelines/Quality/Q5A_R1/Step4/Q5A_R1__Guideline.pdf)

TABLE A-1.—EXAMPLES OF VIRUSES WHICH HAVE BEEN USED IN VIRAL CLEARANCE STUDIES

Virus	Family	Genus	Natural Host	Genome	Env	Size (nm)	Shape	Resistance <sup>1</sup>
Vesicular Stomatitis Virus	Rhabdo	Vesiculo-virus	Equine Bovine	RNA	yes	70 x 150	Bullet	Low
Parainfluenza Virus	Paramyxo	Paramyxo-virus	Various	RNA	yes	100–200+	Pleo/Spher	Low
MuLV	Retro	Type C oncovirus	Mouse	RNA	yes	80–110	Spherical	Low
Sindbis Virus	Toga	Alphavirus	Human	RNA	yes	60–70	Spherical	Low
BVDV	Flavi	Pestivirus	Bovine	RNA	yes	50–70	Pleo/Spher	Low
Pseudo-rabies Virus	Herpes		Swine	DNA	yes	120–200	Spherical	Med
Poliovirus Sabin Type 1	Picorna	Enterovirus	Human	RNA	no	25–30	Icosa-hedral	Med
Encephalomyo-carditis Virus (EMC)	Picorna	Cardio-virus	Mouse	RNA	no	25–30	Icosa-hedral	Med
Reovirus 3	Roe	Orthoreovirus	Various	DNA	no	60–80	Spherical	Med
SV40	Papova	Polyomavirus	Monkey	DNA	no	40–50	Icosa-hedral	Very high
Parvoviruses (canine, porcine)	Parvo	Parvovirus	Canine Porcine	DNA	no	18–24	Icosa-hedral	Very high

<sup>1</sup> Resistance to physico-chemical treatments based on studies of production processes. Resistance is relative to the specific treatment and it is used in the context of the understanding of the biology of the virus and the nature of the manufacturing process. Actual results will vary according to the treatment. These viruses are examples only and their use is not considered mandatory.

**ROBUSTNESS OF VIRAL CLEARANCE IS CHARACTERIZED IN QUALIFIED SMALL SCALE STUDIES USING VIRUS MODEL**

# VIRUS MODEL CHOSEN IN SMALL SCALE STUDY

FOR ILLUSTRATION ONLY

Virus	Genome	Envelope	Family	Approximate Size (nm)	Resistance to Physicochemical Reagents
xMuLV	RNA	Yes	Retroviridae	80 to 110	Low
PrV	DNA	Yes	Herpesviridae	120 to 200	Low
Reo-3	RNA	No	Reoviridae	60 to 80	Medium
MMV	DNA	No	Parvoviridae	18 to 24	High

- Example of a virus panel comprises 4 representative model viruses having different physicochemical properties, size, and chemical resistance, to demonstrate the robustness of viral clearance capability
- These model viruses include members from each of the four major classes of virus (enveloped or non-enveloped, containing DNA or RNA)
- Two enveloped viruses, xenotropic murine leukemia virus (xMuLV) and pseudorabies virus (PrV), model the retrovirus-like particles found in CHO cells and herpesvirus, respectively
- Non-enveloped Reovirus type 3 (Reo-3) has the ability to infect both human and animal cells. Murine minute virus (MMV) is a model rodent virus which can infect CHO cells

# SMALL SCALE VIRAL CLEARANCE STUDY

**GE AxiChrom**  
300 to 1600 mm (Diameter)

**GE Hiscale and Tricorn**  
50 to 5 mm (Diameter)

**SCALE DOWN**

- Small scale models need to be qualified to represent process in production scale
- Use of worst case process conditions
- Replicate of testing is required due to inherent variability of viral assay
- Load material are spiked with model viruses and clearance is expressed in Log reduction

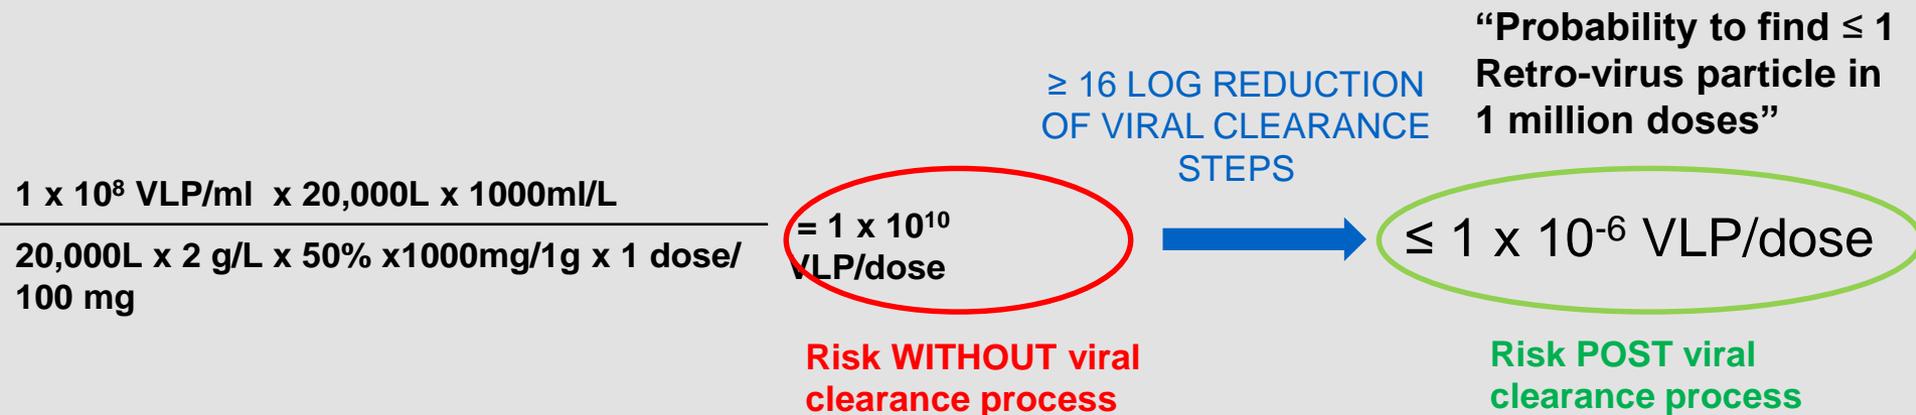

$$\text{Log}_{10} \text{Reduction Value} = \text{Log}_{10} \left( \frac{\text{total virus}_{\text{start}}}{\text{total virus}_{\text{end}}} \right)$$

# LOG REDUCTION CALCULATION FROM SMALL SCALE STUDY

PROCESS STEP	xMuLV	PrV	Reo-3	MMV
Viral Inactivation	≥ 6	≥ 6	-	-
Chromatography	≥ 6	≥ 6	≥ 6	≥ 6
Nanofiltration	≥ 4	≥ 4	≥ 4	≥ 4
Total	≥ 16	≥ 16	≥ 10	≥ 10

FOR ILLUSTRATION ONLY (VALUE PROVIDED ARE RANDOMLY GENERATED FOR EDUCATION PURPOSE)

Assuming harvest bulk material (20,000L, 2 g/L protein) containing  $1 \times 10^8$  retro-virus like particle (VLP)/ml. For 50% purification yield and a final dose of 100mg protein, the risk of finding the VLP in final dose:

# SYNOPSIS

- Introduction
- Validation of viral removal/  
inactivation
- **Bioanalytical method validation**

# QUALIFICATION, VALIDATION AND VERIFICATION

## Qualification

- Insufficient knowledge of the test's performance to document full validation
- A performance assessment has been made to determine reliability and variability

## Validation

- Full knowledge of the test's performance and performance assessment has been made to determine reliability and variability
- Protocol for full validation over a long time frame and with many parameters tested

## Verification

- Applied to validated methods that typically appear in compendia
- To demonstrate ability of the method to perform the test according to stated specifications
- Use available standards from NIST, WHO or Pharmacopeia to in test verification

# WHY BIOANALYTICAL METHOD VALIDATION?

- To assess the fit-for-purpose appropriate for the intended use
- To ensure that the data are reliable
- To provide critical data to support the safety and effectiveness of drugs and biologic products
- Critical for the quantitative evaluation of analytes (i.e., drugs, including biologic products, and their metabolites) and biomarkers in a given biological matrix (e.g. blood, plasma, serum, or urine)

# METHOD VALIDATION PARAMETERS

Test parameters	Description
Sensitivity	Lower limit of detection (LOD), The lowest concentration of an analyte that the analytical procedure can reliably differentiate from background noise
Specificity	Ability to assess unequivocally the analyte in the presence of expected components such as impurities, degraded products and matrix
Precision	Closeness of agreement among measurements obtained from multiple sampling under described conditions
Repeatability	Able to repeat under the same operation conditions, over a short time period
Intermediate precision	Able to obtain the same results within laboratory variations, different days, analysts, equipment, etc.
Reproducibility	Able to obtain the same results among different laboratories variations, different days, analysts, equipment, etc.
Accuracy	Degree of closeness of determined value to the nominal or known true value under prescribed conditions. Accuracy is also sometimes termed trueness.
Quantitation Range	Range of concentration, including upper limit of quantitation (ULOQ) and lower limit of quantitation (LLOQ), that may be reliably and reproducibly quantified through a concentration-response relationship
Linearity	Extent to which the relationship between experimental response value and concentration of the analyte approximates a straight line
Robustness	Ability of the method to deliver accurate, precise results under normal operating-condition variations

# RECOMMENDATIONS AND ACCEPTANCE CRITERIA FOR BIOANALYTICAL METHOD VALIDATION (1)
